

Qivalon Fuel Optimizer

Reduce fuel costs

Optimize refuelling behaviour

Expensive refuelling stops can quickly lead to a shipping order not being profitable anymore. A situation that should be absolutely avoided in the context of small profit margins.

One month's fuel prices in international long-distance traffic

The solution

Fuel Optimizer monitors all refuelling stops and shows where better refuelling could be done.

- ☑ Evaluations of refuelled quantities broken down into various criteria such as providers, countries or stations
- ☑ Permanent control of refuelling costs to detect negative developments in advance
- ☑ Comparison of your refuelling costs with those of other transport companies
- ☑ Automatic detection of cheaper alternatives for refuel stops

Simple integration

Fuel Optimizer works without additional hardware and uses only existing data. All that is needed is a telematics system with an FMS connection, whose data Fuel Optimizer links with the data from the fuel invoices and other external data.
